

CSV Parser

Block Group:	Table Operations
Icon:	

The CSV Parser block converts a CSV string into a table.

This is a commonly used block, because many data-driven features in DGLux5, such as charts and repeaters, require tabular data.

The CSV parser block is often used to parse a string that has been retrieved using a [String Loader block](#).

For information on using dataflow blocks, see [Dataflow](#).

For answers to some common questions about working with tables, see [Tables](#).

Video Tutorial: Import CSV File

More video tutorials are [here](#).

Input/Output Properties

The following properties of the CSV Parser block can take input and give output.

- **input** (*string*)
- **withHeader** (*boolean*)
- **delimiter** (*character*)

input receives the CSV string. It is often the output from a String Loader block.

withHeader specifies whether the CSV string includes a header row.

delimiter specifies the character that separates items in the CSV string. Typically this character is a comma (,).

Output Properties

The following properties of the CSV Parser block can give output but cannot take input.

- `parseError (boolean)`
- `output (table)`

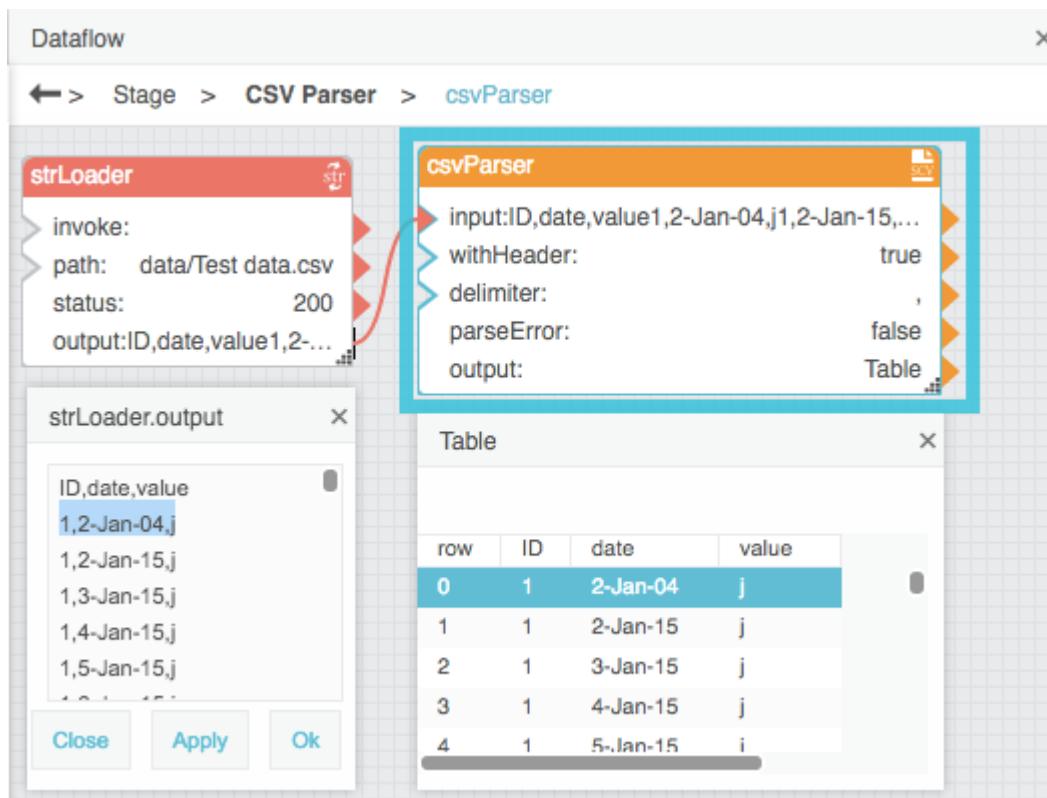

parseError indicates whether the block encountered an error. An error might be caused by improperly formatted input.

output returns a table parsed from the CSV data.

Example

The following image shows, clockwise from top left:

- A [String Loader](#) block
- A CSV Parser block
- The output table of the CSV Parser block
- The CSV file
