

# Radian

Block Group:	Trigonometric Functions
Icon:	

The Radian block converts degrees to radians.

For information on using dataflow blocks, see [Dataflow](#).

---

## Input/Output Property

The following property of the Radian block can take input and give output.

- input (*number*)

**input** specifies the angle in degrees, to convert to radians.

---

## Output Property

The following property of the Radian block can give output but cannot take input.

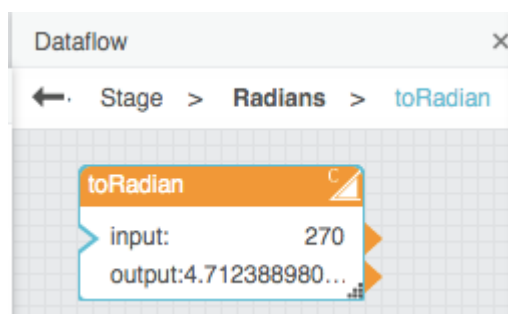

- output (*number*)

**output** returns the input value, converted from degrees to radians.

---

## Example

The following image shows an example of the Radian block. In this example, 270 degrees is converted to radians.

Previous: Degree

Next: Sine
