

Binary

Block Group:	Variables
Icon:	no icon

The Binary block holds binary data, such as the contents of a file.

In the Property Inspector, the **value** property of the Binary block is set with a file chooser. When you choose a file, the file is read in the browser and its contents are stored in the block as binary data. You can then bind **value** to properties that accept binary data, such as the input of a [Blob URL](#) block.

For information on using dataflow blocks, see [Dataflow](#).

Input/Output Property

The following property of the Binary block can take input and give output.

- value (*binary*)

value sets and returns the binary data held by this Binary block. If no file is chosen, **value** is null.
