# Create a Project

In DGLux5, you do all of your design work within a project, so the first thing you need to do is create a project to work in.

To create a new project:

1. Log in to DGLux5, and select **Project** > **New Project**.

   The Welcome dialog opens.

2. Choose **Create New**.

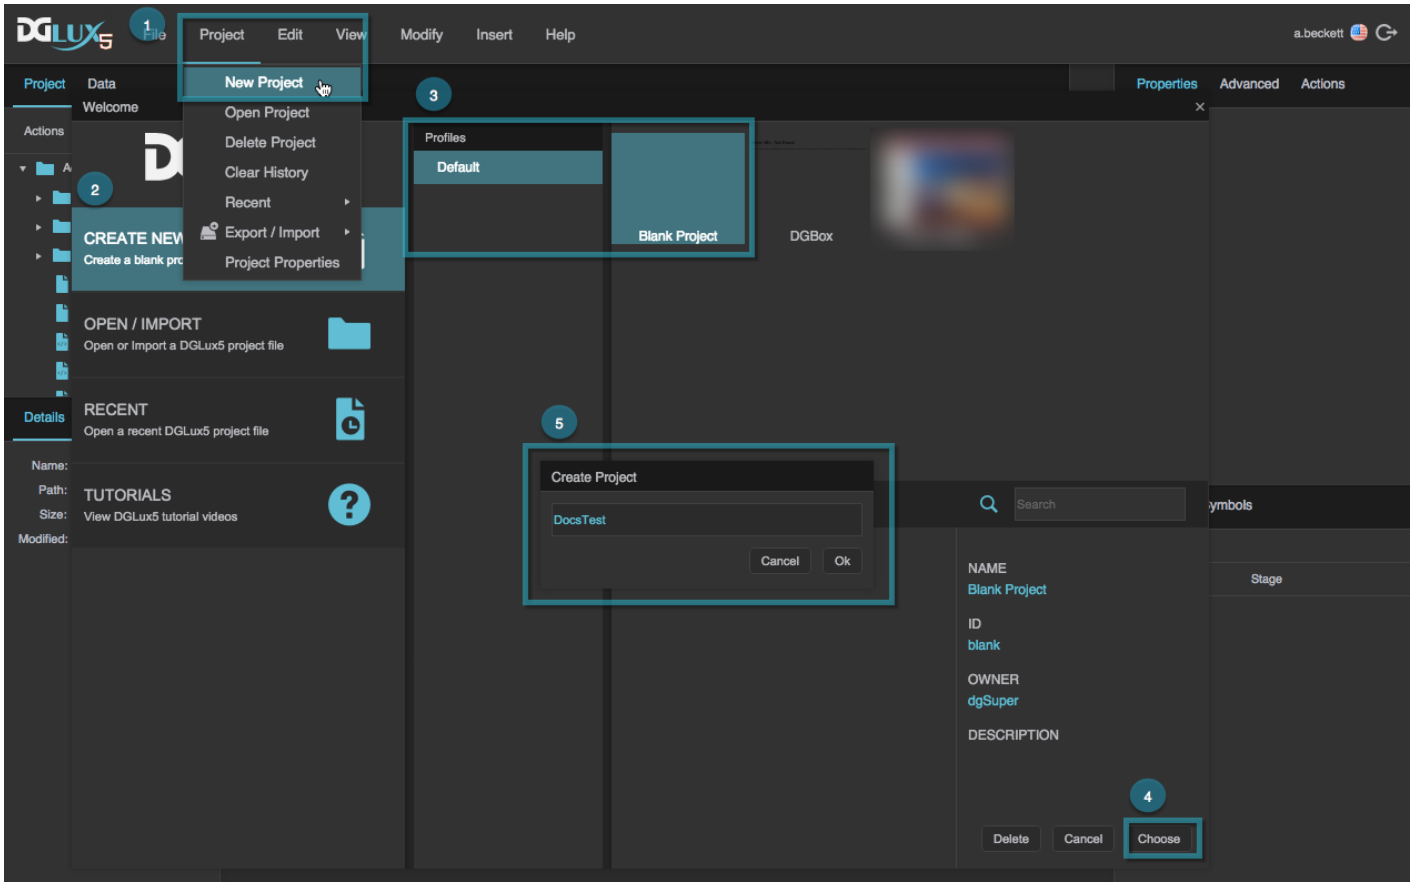

3. Select a profile and template.

   Which profiles and templates are available depends on your installation of DGLux5.

   To use no template, choose the **Default** profile and the **Blank Project** template.

4. Click **Choose** in the bottom right corner of the Welcome dialog.
5. When prompted, enter a name for your project, and click **OK**. The following characters are not allowed in the project name `: \ ? # * " / |`
6. Either double-click `index.dg5` in the Project panel to start designing your home page, or select **File** > **New File** to create a new `.dg5` file.

To learn more, see Projects and DG5 Files
