

# Deploy a Project

You can create a customized Project Assist experience for each DGLux5 account.

To deploy a project to specific DGLux5 users:

1. Click **Home** to return to the home page of Project Assist.
2. Click the  **Settings** icon in the bottom-right corner of the page.

3. In the Project User Permissions dialog, select a user, and for **Mode** specify either **edit** or **view**.

**edit** lets this user edit your Project Assist project. **view** lets them view the project only.

## Tips

You can also use the Project User Permissions dialog to:

- Set whether the user sees help tips when editing the project.
- Set a landing page to open on login, if the user has view-only access.
- Limit the Project Tree nodes that the user can see and access, if the user has view-only access. For example, you could give a user access to only one relevant building or site.

If a node that the user can access node has children, the children are also viewable to the user.

If a node that the user can access has a zone that navigates to an inaccessible page, clicking the zone does nothing.

4. Close the pop-up.
5. In the top right corner of the page, click **Launch**.

6. Copy the URL of the page that opens, and give it to the user. They can log in with their DGLux5 username and password.

The URL that opens should end with #view. If it ends with ?proj=<your project name>, then add #view at the end of the URL before sharing it.
