

# Manage Layers

Layers are an essential aspect of Project Assist zones and widgets.

To create a color-coded layer composed of zones:

1. Click **Build** or **Manage Dashboards**.

2. In the Project Tree, click  **Layer Manager**.

The Layer Manager dialog opens.

3. Select a layer.

If you already created zones, select the layer that holds the zones.

4. In the right panel, for each device template, choose the point to map to this layer.

A drop-down menu is available for each [device template that you have added to this project](#).

*For the Temperature Layer, for the VAV template, the Room\_Temp point is selected.*

5. If you want, edit the minimum and maximum of the range.
6. If you want, edit the color gradient. Click on the gradient to open a Fill dialog. In the dialog:
  - Click below the track to add colors.
  - Right-click a color to delete it.
  - Drag colors to move them.

*Editing gradient colors in the Fill dialog*

*A layer showing real-time room temperature data*
