Create a Location Page

To create a location page:

1. Click **Build** or **Manage Dashboards**.

   

2. In the Project Tree, click the gray or white button next to a location node.

   

   The location page editor opens.

3. Make sure the  **Image** tab is selected, and drag the image file to the specified area.

   

   Your page is created, and your image appears in the canvas.

4. At any point, you can click the **Widgets** tab and then click **Submit** to save your changes to this page.

   

Tip

The image fills the whole page. If you want empty space around the image for widgets, use an image editor to add the empty space.
