

# Date Input

The date input component allows the user to choose a date. It accepts a year, month, and day, but not a time.

To use this component, first you insert it by selecting **Insert > Form > Date Input**. Then, you configure style and behavior using [properties](#).

For more information about using input components, see [Designing Input Components](#). For a detailed reference of properties that affect input components, see [Common Properties](#) and [Input Component Properties](#).

A date input component in DGLux5
