IFrame Properties

These properties affect the IFrame component.

For a guide to using the IFrame component, see IFrame.

IFrame components are also affected by Common Properties.

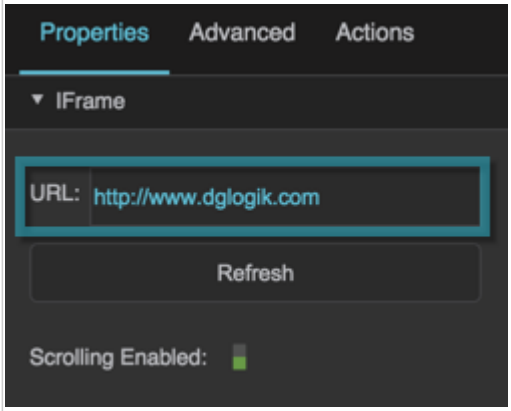

The IFrame properties in the Property Inspector

Click to display/hide all elements

URL
Specifies the URL to be displayed within the IFrame.

This allows you to use third-party or your own standalone CSS, JavaScript, and HTML components in your DGLux5 application. Your custom components will behave as if they were native DGLux5 components.

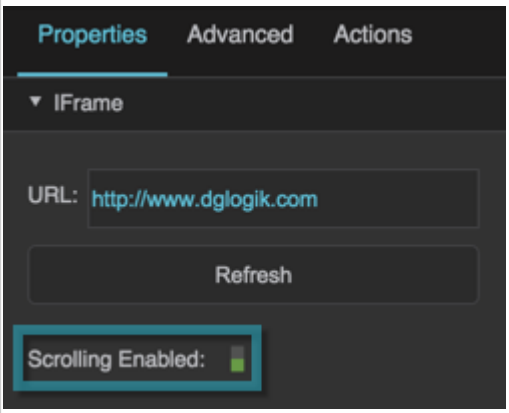

The URL property

Refresh
Reloads the content of the IFrame from the current URL.

Scrolling Enabled / Scrolling Disabled

Specifies whether scrolling is enabled on the IFrame component. If scrolling is disabled, then content that overflows the component is clipped.

The IFrame Scrolling property

allow
Available in the Advanced Property Inspector and in dataflow. Sets the HTML `allow` attribute (permissions policy) of the IFrame, for example `fullscreen; camera; microphone`.

On Load
Available in the Advanced Property Inspector. An event that fires each time the IFrame finishes loading its page.
