

Edit and Preview

You can change the application between Edit mode and Preview mode. Edit mode lets you select components in the [Document window](#) for editing. Preview mode enables user interactions with the page, such as clicking.

To change between Edit and Preview mode, use the **Preview** and **Edit** buttons at the top of the Document window.

Switching from Edit mode to Preview mode

When you change to Preview mode, if a [dataflow window](#) is open, the window is hidden to make it easier for you to interact with items on the page. To cause the dataflow window to reappear, you can click the **Preview** button a second time.

Use Preview Mode Temporarily

Temporarily change to Preview mode by holding down the P key. While you are holding the P key, you can interact with items on the page. When you release the P key, DGLux5 returns to Edit mode.
