

# Tools and Quick Access Panels

The Tools panel and Quick Access panel are narrow columns of buttons that appear immediately to the left and right of the [Document window](#). On the left, the Tools panel contains tools for selection, transformation, drawing, and default styles. On the right, the Quick Access panel contains operations for arranging, grouping, aligning, converting to symbol, and undo and redo.

You can view information about any tool or command by mousing over it.

## Single and Multiple Drawing Modes

All drawing tools in the Tools panel have two modes: single drawing mode and multiple drawing mode.

### Single Drawing Mode

Use single drawing mode when you need to draw one element in the [Document window](#). After you draw one element, the  **Selection** tool automatically becomes active.

1. Click once on the tool that you want to use.

The tool is selected, and its icon has a number 1 overlay indicating single drawing mode:

2. Draw your element in the Document window.

After you draw the element, the  **Selection** tool is automatically selected. You can adjust your element if needed.

### Multiple Drawing Mode

Use multiple drawing mode for drawing multiple elements consecutively. The current tool stays active until you change it.

1. Click twice on the tool that you want to use.

The tool is selected and does not have a number 1 overlay:

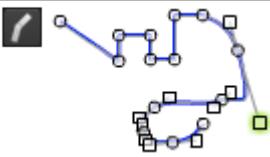

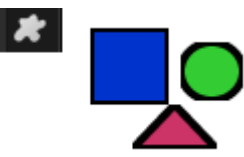

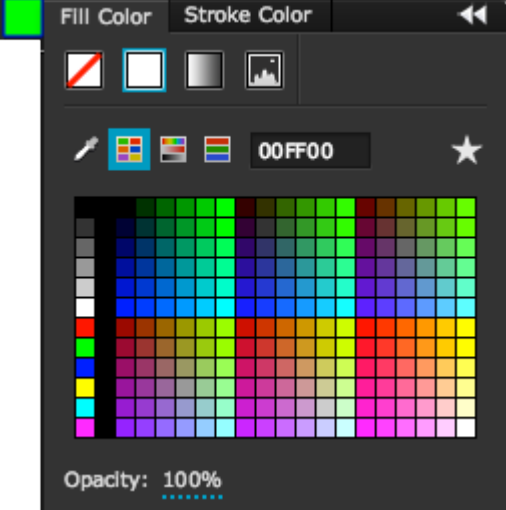

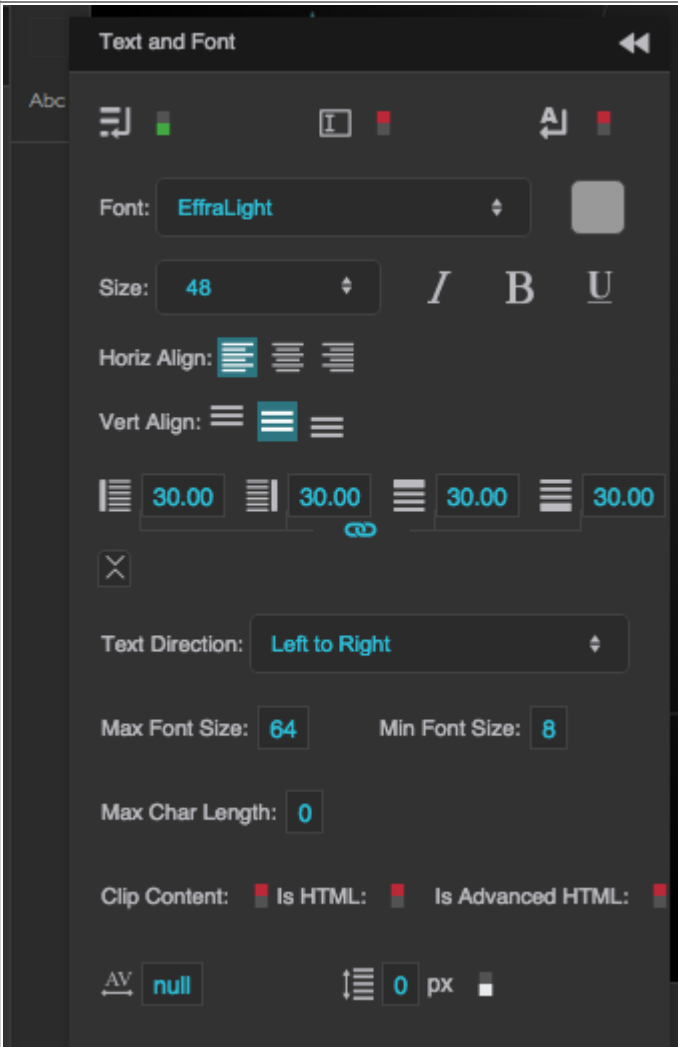

2. Draw multiple elements using this tool.
3. When you are finished drawing, select a different tool.

### Tool Functions and Examples

These are examples and descriptions of using the tools in the Tools panel.

Example	Description
	The <b>Selection</b> tool (S) selects an entire object in the <a href="#">Document window</a> and can move and resize the object.
	The <b>Path Selection</b> tool (Ctrl + Shift + P) selects shapes or segments and shows anchor points, direction lines, and direction points.

Example	Description
	<p>The <b>Free Transform</b> tool (T) scales and rotates objects. It also moves the anchor point around which an object can be rotated. For more information, see <a href="#">Free Transform Tool Examples</a>.</p>
	<p>The <b>Rectangle</b> tool (R) draws squares and rectangles with and without rounded corners.</p>
	<p>The <b>Ellipse</b> tool (E) draws circles and ovals.</p>
	<p>The <b>Path</b> tool (Ctrl + P) draws straight and curved lines that create shapes with or without fill.</p>
	<p>The <b>Line</b> tool (L) draws individual straight lines and concave or convex curve segments.</p>
	<p>The <b>Polyline</b> tool (W) draws multiple connected straight lines or curves.</p>
	<p>The <b>SVG Rectangle</b>, <b>SVG Ellipse</b>, and <b>SVG Triangle</b> tools draw rectangle, ellipse, and triangle SVG shapes. They can be found in the  Shape tool menu. SVG shapes are richer than native html shapes, but they need more system resources.</p>
	<p>The <b>Default Line Stroke and Fill</b> tool sets the new default line, stroke, and fill. These properties are used for the line, stroke, and fill of objects that are created in the <a href="#">Document window</a> using tools in the Tools panel.</p>

Example	Description
	<p>The <b>Default Text and Font</b> tool sets the new default text and font properties. These properties are used for text components that are created in the <a href="#">Document window</a>.</p>

## Free Transform Tool Examples

This video shows the three uses of the  **Free Transform** tool.

[dglux5\\_transform\\_tool.mp4](#)

The video shows these actions:

- To scale an object, drag the points that appear on the object's edges.
- To rotate an object, drag the outermost corner points.
- To move the anchor point around which an object can be rotated, click the anchor point and drag it. By default, the anchor point is in the center of the object.

Rotating an object using the Free Transform tool changes the object's [Transform Properties](#). Moving an object's anchor point changes the **transformOriginX** and **transformOriginY** properties in the object's [Advanced properties](#).
