

# Date Formatter

The Date Formatter is a widget that allows you to transform a given Timestamp into a specified format for use in your dashboard.

## Workflows

The Standard Workflow when using a Date Formatter is to first define the source for your timestamp. This is often a binding from a station point or column value. After defining the source for the timestamp, you then have the option to define exactly how the timestamp should be transformed before it is displayed on your dashboard.

## Properties

Preview	Property	Description
<b>Date Formatter</b> <b>Input Date</b> <input type="text"/> <b>Format Pattern</b> <input type="text" value="EEEE, MMM. D, YYYY at L:NN:QQ!"/> <b>Result</b> <input type="text"/>	Input Date	Specify Date to be Formatted
	Format Pattern	Specify how Date should be Formatted
	Result	Output Property of Formatted Date
