

Group By

The Group By Widget allows you to group elements from the source table based on defined values, and also define how the other columns are rolled up.

Workflows

The Standard Workflow for using a Group By widget is to start by defining your source table. The next step is to decide what to group on. This value is typically a category name or timestamp. By defining a column to Group By, the output table will populate with multiple rows grouped depending on what is defined, effectively joining categories. The next step is to define how the rest of the column data is rolled up. This is typically set to sum or count. Finally, you are ready to bind the output table to the next step in your dashboard, such as a repeater or chart.

Properties

Preview	Property	Description
	Input	Table of Data to perform Group By function on
	Sheet ID	Numeric Value of Sheet to use from Table
	Output	Table of Data based on Column Conditions
	Update	When Invoked, will Update the widget and Output Table
	Column Name	A Group will be created for each Column from Input Table
	Group By	If Enabled, will use Column for Grouping Function
	Show Column	If Enabled, will display Column in Output Table
	Function	none, min, max, avg, sum
